LABEL-FREE BINDING ANALYSIS

MICROCALORIMETRY

MICROCAL ITC SYSTEMS

UNDERSTANDING BIOMOLECULAR INTERACTIONS

MEASURE MULTIPLE BINDING PARAMETERS IN A SINGLE EXPERIMENT

Isothermal titration microcalorimetry (ITC) is an essential tool for drug design and the study and regulation of protein interactions. Having been developed specifically to meet the needs of life scientists working in these fields, Malvern MicroCal ITC calorimeters deliver the exceptional performance and outstanding quality data needed to accelerate drug development.

MicroCal ITC systems directly measure the heat released or absorbed during a biomolecular binding event. The result is direct, label-free measurement of binding affinity and thermodynamics in a single experiment, delivering comprehensive information for studying a wide variety of biomolecular interactions.

Offering high sensitivity, a wide affinity range, reduced sample consumption and options for high throughput with walk-away automation, MicroCal ITC microcalorimeters fully meet the demanding requirements of today's research laboratories. They also provide the security associated with a product portfolio based on more than 30 years of experience in microcalorimetry. This is supported by tens of thousands of scientific papers that confirm the value of these technologies in research and development.

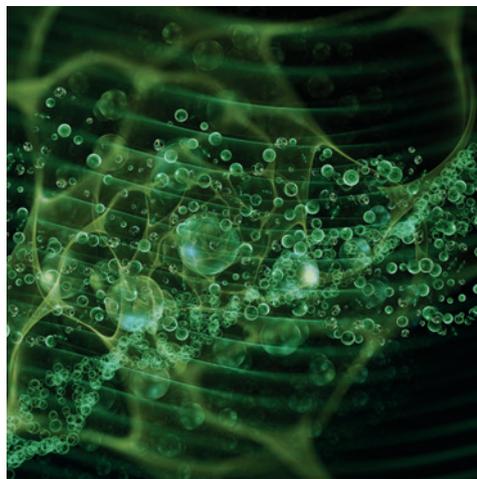

Key benefits of Malvern MicroCal iTC systems

MicroCal iTC isothermal titration calorimeters all allow direct, label-free in solution measurement of binding affinity and thermodynamics in a single experiment, **enabling the accurate determination of binding constants (K_b), reaction stoichiometry (n), enthalpy (ΔH) and entropy (ΔS). This provides a complete thermodynamic profile of the molecular interaction. ITC goes beyond binding affinities and can elucidate the mechanisms underlying molecular interactions.**

A range of systems to suit your requirements.

- MicroCal Auto-iTC200 combines the high sensitivity of the MicroCal iTC200 with walkway automation to meet the productivity needs of busy research and drug discovery laboratories.
- MicroCal iTC200 delivers exceptional sensitivity and high quality data with low sample consumption, in an environment that offers flexible experimental conditions.
- MicroCal VP-ITC is designed for ease-of-use, delivering fast, accurate analysis and outstanding data sensitivity for academic and research environments.

Applications

Used widely in the life sciences and drug discovery with key applications in:

Characterizing biomolecular interactions, to:

- Confirm binding and activity
- Determine stoichiometry and thermodynamic parameters

Studying the interaction of any two biomolecules including:

- Proteins, nucleic acids, lipids, drugs and inhibitors
- Structural biology and structure-activity relationships

Drug discovery for:

- Hit validation and characterization
- Lead optimization
- Mechanism of action

Model	Sample volume	Sample cell size	Operation	Throughput
MicroCal Auto-iTC200	370 μ L	200 μ L	Fully automated	Up to 42 per 24 h (SIM)
MicroCal iTC200	280 μ L	200 μ L	Manual	8 - 12 per 8 h day
MicroCal VP-ITC	2 mL	1400 μ L	Manual	4 - 8 per 8 h day

INTRODUCTION TO ISOTHERMAL TITRATION MICROCALORIMETRY

Isothermal titration microcalorimetry (ITC) measures the binding affinity and thermodynamics of biomolecular interactions, helping to understand why interactions occur. The technique is based on the measurement

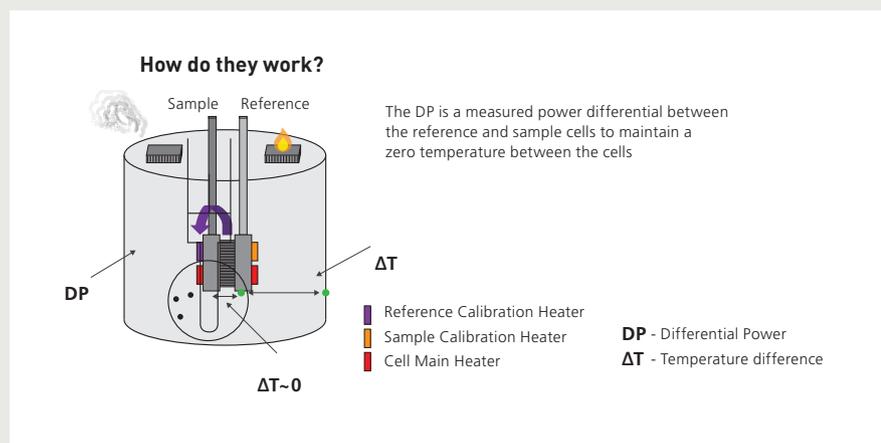

of heat evolved or absorbed when complexes are formed between molecules. It has the advantage of measuring all binding parameters in a single label-free, in-solution experiment, including binding affinity (K_D),

reaction stoichiometry (n), enthalpy (ΔH), and entropy (ΔS). This reveals thermodynamic data, the forces that drive complex formation, enabling function and mechanism to be described at a molecular level.

The benefits of ITC

- **Label-free measurement - ensures analysis of unaltered biomolecules in their native state giving a true picture of behavior.**
- **Broad dynamic range - measurement of molecules in solution preserves biological relevance and the sensitivity of the technique accommodates a wide range of affinities.**
- **Information rich data - all relevant parameters – affinity, stoichiometry, enthalpy and entropy – are measured in a single experiment.**
- **Ease of use – quick to first result with minimal assay development, no labelling, no immobilization and no molecular weight limitations.**
- **Ease of use - measurements can be made under a wide variety of solvent and buffer conditions.**

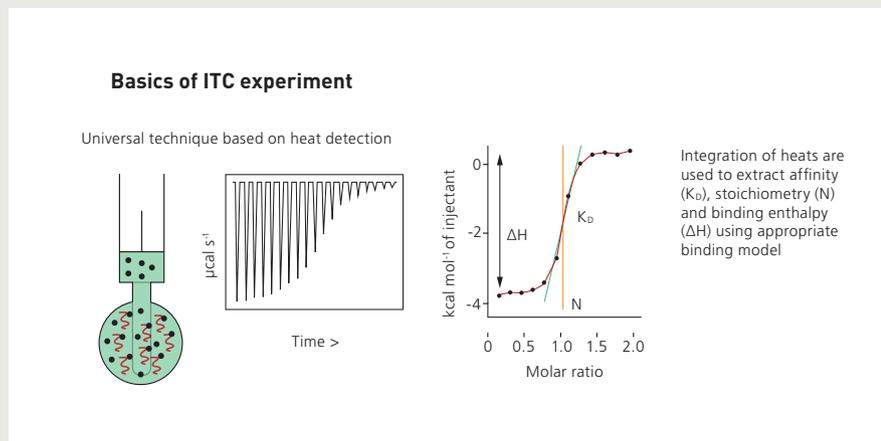

Theory into practice

Isothermal titration microcalorimeters measure the heat change that occurs when two molecules interact. Heat is released or absorbed as a result of the redistribution and formation of non-covalent bonds when the interacting molecules go from the free to the bound state. ITC monitors these heat changes by measuring the differential power, applied to the cell heaters, required to maintain zero temperature difference between the reference and sample cells as the binding partners are mixed.

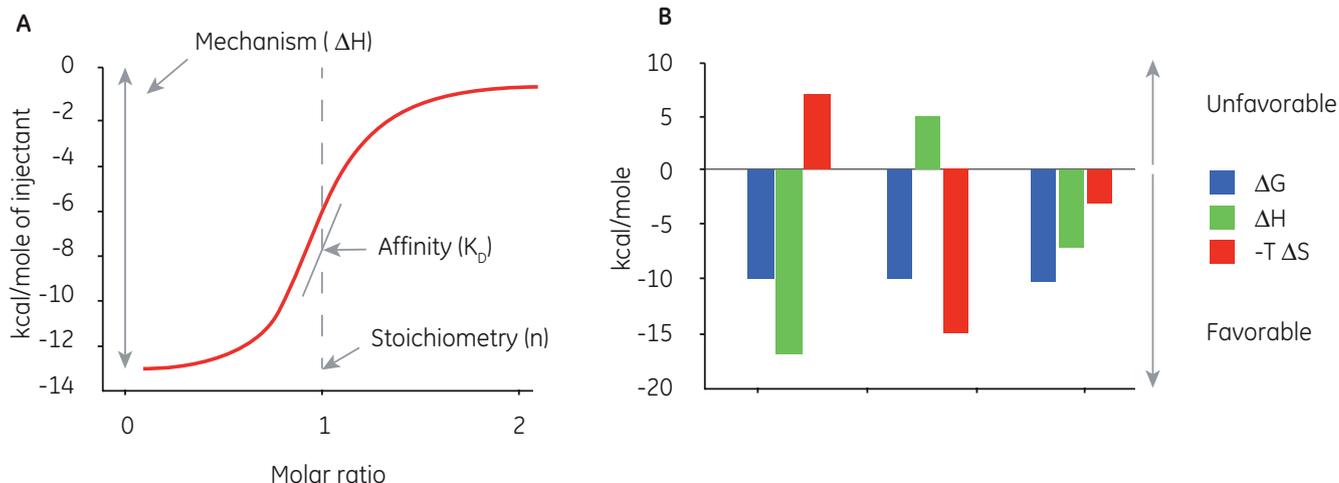

The reference cell usually contains water, while the sample cell contains one of the binding partners (the sample, often but not necessarily a macromolecule) and a stirring syringe which holds the other binding partner (the ligand).

The ligand is injected into the sample cell, typically in 0.5 to 2 μL aliquots, until the ligand concentration is two- to three-fold greater than the sample. Each injection of ligand results in a heat pulse that is integrated with respect to time and normalized for concentration to generate a titration curve of kcal/mol vs molar ratio (ligand/sample). The resulting isotherm is fitted to a binding model to generate the affinity (K_D), stoichiometry (n) and enthalpy of interaction (ΔH).

THE POWER OF ITC

Isothermal titration calorimetry determines thermodynamic properties that tell you why interactions occur. Thermodynamic data reveal the forces that drive complex formation to describe function and mechanism at a molecular level.

A. ITC determines thermodynamic properties including: the stoichiometry of the interaction (n), the affinity constant (K_b), change in enthalpy (ΔH), and change in entropy (ΔS).

B. Shown are thermodynamic signatures of three interactions that have the same binding energy (ΔG). The binding energy is related to the affinity. Binding affinity is a combined function of the binding enthalpy (ΔH) and the binding entropy (ΔS). Binding enthalpy reflects the strength of the interaction due to hydrogen bond formation and van der Waals interactions. Binding entropy is a combination of the change in entropy from desolvation and conformational changes upon complex formation.

Delivered by MicroCal systems

Minimum preparation, maximum results, high productivity

- All binding parameters (affinity, stoichiometry, enthalpy and entropy) in a single experiment
- Directly measure sub-millimolar to picomolar dissociation constants (10^{-2} to 10^{-12} M) using direct or competitive binding techniques
- Outstanding sensitivity and data quality gives confidence in results
- Perform a label-free, in solution investigation of any biomolecular interaction using as little as 10 μ g protein
- Get first results fast with no assay development needed
- Coin shaped cell optimizes sample mixing
- Nonreactive Hastelloy for chemical resistance and compatibility with biological samples
- Compatible with non-aqueous solvents
- Automate for the highest productivity

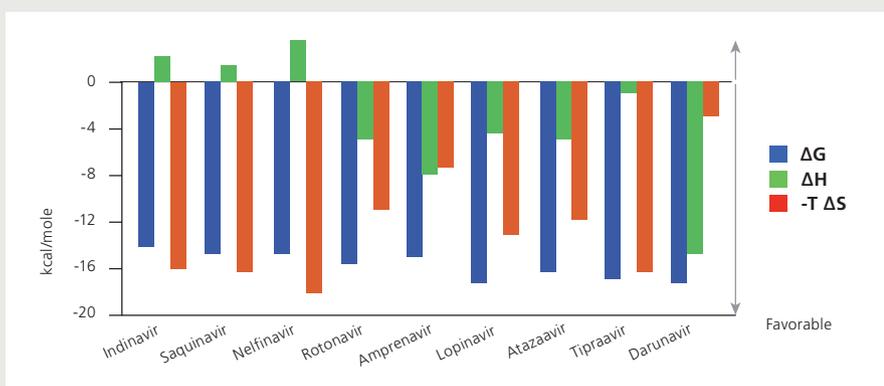

ITC IN ACTION – PROVEN VERSATILITY

Theory into practice

Thousands of citations in reference databases illustrate the diverse applications of MicroCal ITC systems. They are used to measure the binding affinity and thermodynamic properties of any biomolecular change that can influence recognition between binding partners.

When combined with structural information, ITC data provide deeper insights into structure-function relationships and the mechanisms of binding. While the following examples provide a snapshot, you can find a wealth of detailed applications information at: www.malvern.com

Take lead optimization to a new level

Thermodynamic signatures for a complete series of HIV-1 protease inhibitors. The signatures indicate that the most effective and recently developed drugs are more enthalpically driven than the original versions. Data from Freire, *Drug Discov Today*, 2008 October; 13(19-20): 869-874.

Deeper insights

Drugs should bind to targets with high affinity and selectivity. Traditionally, lead optimization has been driven by studies of the affinity component.

Yet the thermodynamic variables (ΔH , ΔS) are also fundamental to binding and can provide deeper insights into the interactions. MicroCal ITC calorimeters have the sensitivity and throughput for efficient determination of all the binding parameters that can guide lead optimization.

The value of thermodynamics

ITC permits a multidimensional approach where the contribution of enthalpy and entropy to affinity can indicate favorable chemical modifications to design better drugs, faster. The example shown compares the thermodynamic signatures of a series of HIV-1 protease inhibitors and shows favorable enthalpy for the more effective drugs.

Second generation HIV-1 protease inhibitors, such as Darunavir, have a higher contribution of enthalpy to the total binding energy than first generation therapeutics, such as Indinavir. The conclusion from this study was that the investigation of the interplay between enthalpy and entropy in structure/activity relationships (SAR) would help design new drugs that bind with higher affinity and selectivity.

Characterize any bimolecular change that can influence recognition between binding partners

With Isothermal Titration Calorimetry you can:

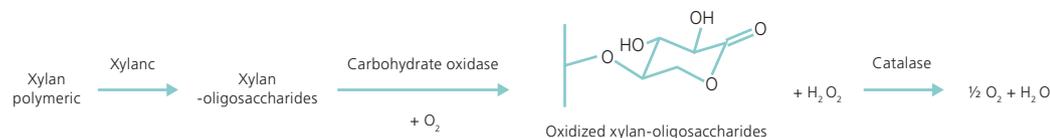

- Verify target activities prior to screening.
- Resolve binding into affinity, the number of binding sites, enthalpy, and entropy.
- Gain a deeper understanding of binding mechanisms for any biomolecular interaction.

Protein-protein interactions are fundamental to all cellular processes and when they malfunction are often the root cause of disease. CHO and coworkers used ITC to understand the role of disordered regions of the protein in molecular recognition. This was achieved by comparing a wild-type protein containing a disordered region (SEC3-WT) with three evolved variants. The results indicated that disordered regions significantly affected the binding energetics. The authors concluded that this type of ITC study has the potential to improve predictive algorithms for protein-protein interactions

OPTIMIZING ENZYME KINETICS WITH ITC

The kinetics of xylanase is important in bio-bleaching wood pulp and biofuel production. Baumann and coworkers developed a system to measure xylanase kinetics with ITC since the traditional method was complicated and prone to systematic errors. The ITC method was also found to offer greater sensitivity and used less material.

Typically, heat changes associated with xylan hydrolysis are too small to measure directly with ITC. To boost heat flow, an enthalpy amplification system that involved carbohydrate oxidase and catalase was developed. This generated an enthalpy change that allowed measurement by MicroCal iTC200, with signals that corresponded to the amount of mixed xylan oligosaccharides injected.

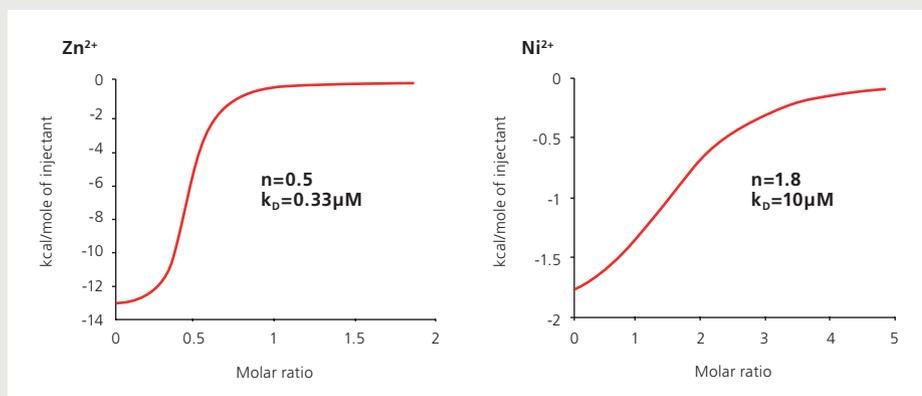

Reaction scheme. (Adapted from Baumann, M.J. et al., *Anal. Biochem.* 2011; **410**:19-26)

Zinc-induced dimerization of a chaperone

Zambeli and coworkers used ITC to understand the role of disordered regions of UreG, from *Helicobacter*. UreG is a molecular chaperone that activates urease by delivering two nickel ions. The process involves GTP hydrolysis and uses several proteins and metal-ion interactions. Since UreG is unstructured in solution, it has been difficult to understand the structure function relationships.

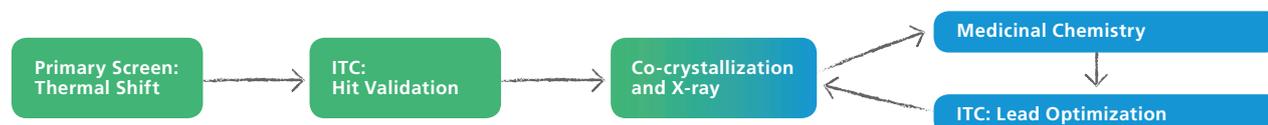

Conflicting evidence suggests that UreG can exist as a monomer or as a dimer. ITC measurements of the stoichiometry indicated that UreG could exist in either form depending on the species of metal ion. Zinc bound to UreG (Affinity $0.33 \mu\text{M}$) with two proteins to each ion suggesting that zinc ions cause dimerization. Whereas a close analog, HpUreG, bound nickel with a 20-fold weaker affinity than zinc. The stoichiometry indicated that two nickel ions bound to each protein in process that does not require protein dimerization.

Predictive power and productivity

MicroCal Auto-iTC200 was used to identify and optimize potential lead compounds in an early drug discovery program for treatment of drug resistant tumors. MicroCal Auto-iTC200 data was used to validate hits from a primary screen and to accurately rank the affinities of the fragments so that only the strongest binders were selected for co-crystallization attempts and structure based drug discovery program.

The approach successfully predicted which hits would form co-crystal complexes with the target. This was clearly demonstrated, when 12 of the 14 protein complexes chosen from the ITC validation were successfully crystallized. This study underlines that the predictive power of ITC can streamline a fragment based drug discovery (FBDD) workflow and save time.

MICROCAL ITC RANGE AT A GLANCE

MicroCal Auto-iTC200

Combining exceptional performance of the MicroCal iTC200 with full automation and unattended operation, the commercially-proven MicroCal Auto-iTC200 is a valuable asset for any busy research laboratory. User-friendly software ensures efficient experimental design while automated data analysis delivers fast, reliable results. The automation and throughput it offers make it a particularly good choice for drug discovery applications such as hit validation where productivity is crucial.

FEATURES:

- Fully automated with capacity to run four -96-well plates unattended
- Optimized automation scripts for improved performance and assay reliability
- Software that streamlines workflows and improves data analysis consistency for confident decision-making

MicroCal iTC200

The MicroCal iTC200 is designed for ease of use and exceptional sensitivity. Its wide affinity range enables analysis of weak to high affinity binders with excellent reproducibility. Syringe and cell cleaning functions are semi-automated and require minimal operator involvement. User-friendly software guides all operations for fast accurate analysis. MicroCal iTC200 is an essential tool for any research laboratory studying biomolecular interactions where high sensitivity and rapid results are paramount.

FEATURES:

- Analyses all binding parameters (affinity, stoichiometry, enthalpy, entropy) in a single experiment
- Quick to first result with minimal assay development and no labelling
- Sensitive enough to investigate biomolecular interaction using as little as 10 µg protein
- Directly measures millimolar to nanomolar affinities (K_D s) (10^{-2} to 10^{-9} M)
- Measures nanomolar to picomolar disassociation constants using competitive binding techniques (10^{-9} to 10^{-12} M)
- Experimental design wizards and automated data analysis for fast reliable results
- Upgradable to fully automated MicroCal Auto-iTC200 system

MicroCal VP-ITC

MicroCal VP-ITC is a sensitive isothermal titration microcalorimeter that is easy to use. Operated via a software interface it delivers fast and accurate analysis. Applications include characterization of the molecular interactions of proteins, antibodies, nucleic acids, lipids and other biomolecules. It is widely used in academia and research laboratories for lead optimization, hit validation, assessing the effect of molecular structure changes on binding mechanisms, and for investigating enzyme kinetics.

FEATURES:

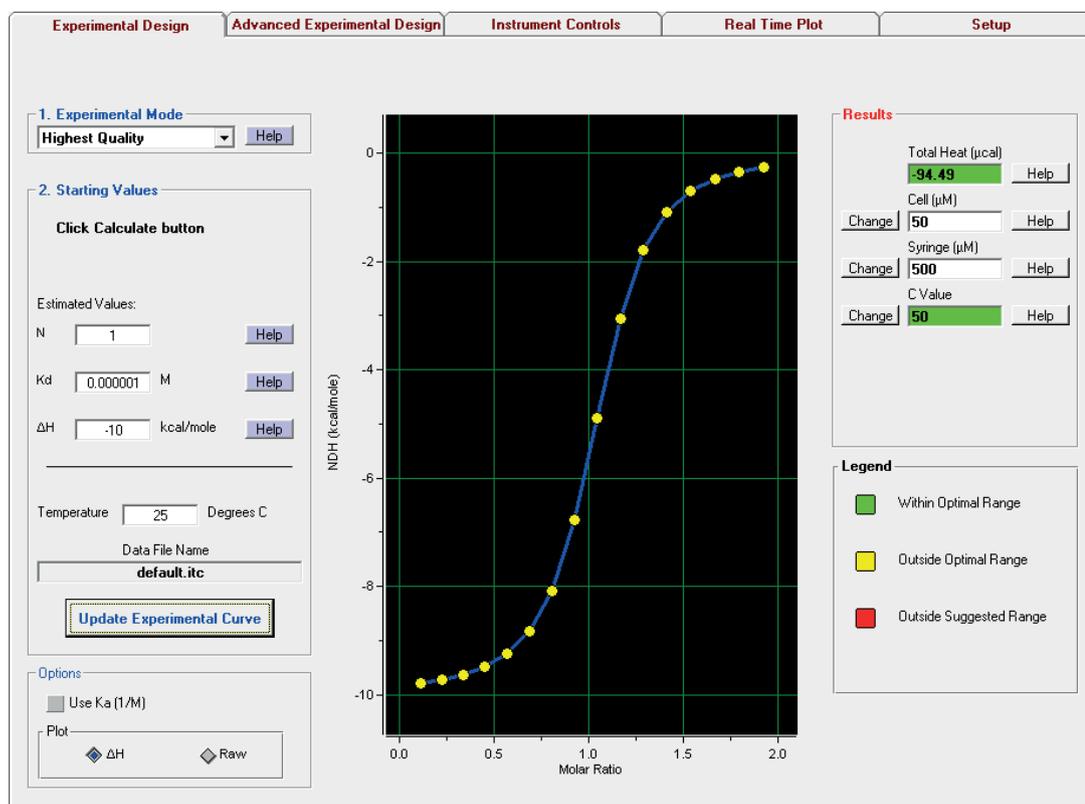

- Affinity data provide insights into biomolecular interactions
- The ability to investigate any biomolecular interaction
- Convenience and speed since there is no need for immobilization and labeling
- Free choice of buffers and no limitations with respect to molecular weight
- Unattended operation after sample loading, allowing you to focus on other tasks
- A complete system without the need for additional accessories, reagents or consumables

USER-FRIENDLY SOFTWARE FOR FAST AND ACCURATE ANALYSIS

MicoCal's ITC systems have become user-friendly, ultrasensitive, and provide clear answers to your questions about biomolecular interactions. The user friendly software guides all operations to facilitate fast and accurate analysis.

The instrument and control software incorporates optimised scripts for sample equilibration and cell cleaning. Data analysis has a unique baseline fitting algorithm eliminating the need for tedious post run manual manipulation.

Experimental design tab permits the user to simulate basic experimental runs.

SPECIFICATION COMPARISON SUMMARY

Parameter	ITC		
	Auto iTC200	iTC200	VP ITC200
Measurement parameter	Affinity (K_D)	Affinity (K_D)	Affinity (K_D)
Measurement parameter	Enthalpy ΔH	Enthalpy ΔH	Enthalpy ΔH
Measurement parameter	Entropy ΔS	Entropy ΔS	Entropy ΔS
Measurement parameter	Stoichiometry (n)	Stoichiometry (n)	Stoichiometry (n)
Sample capacity	384 (four 96 well plates)	N/A	N/A
Sample tray temp range	4°C± 2°C at ambient	N/A	N/A
Sample volume	370 μ L	280 μ L	2 mL
Cell volume	200 μ L	200 μ L	1400 μ L
Injection syringe volume	40 μ L	40 μ L	300 μ L
Injection volume precision	< 1% @ 2 μ L	< 1% @ 2 μ L	-
Equilibration time from 25 °C to 5 °C	< 6 min	< 6 min	-
Sample presentation	96 well plate	N/A	N/A
Throughput	Up to 42 per 24 h (SIM)	8-12 per 8 h day	4-8 per 8 h day
Cell material	Hastelloy	Hastelloy	Hastelloy
Cell configuration	Coin-shaped	Coin-shaped	Coin-shaped
Noise	0.2 ncal/s	0.2 ncal/s	0.2 ncal/s
Temperature Range	2 °C to 80 °C	2 °C to 80 °C	2 °C to 80 °C
Temperature stability at 25 °C	± 0.00015°C	± 0.00015°C	-
Response time	10 s	10 s	20 s
Multiple feedback modes	Yes (passive, high gain, low gain)	Yes (passive, high gain, low gain)	Yes (passive, high gain, low gain)
Automated upgrade available	N/A	Yes	N/A
Operating Environment			
- Temperature range	10 °C to 28 °C	10 °C to 28 °C	10 °C to 28 °C
- Humidity	0% to 70% RH, non condensing	0% to 70% RH, non condensing	0% to 70% RH, non condensing
Electrical ratings			
- Voltage	100 - 240 V	100 - 240 V	100 - 240 V
- Frequency	50/60 Hz	50/60 Hz	50/60 Hz
- Power	70 W	70 W	120 W
Weight	91 kg	9.4 kg	11.5 kg (calorimeter) 9 kg (controller)
Dimensions (W x H x D)	63 x 77 x 35 cm	21 x 34 x 35 cm	20 x 44 x 37 cm (calorimeter)

*Using typical run parameters (cell cleaning with detergent, 12 x 3 mL injections)

VALIDATION AND SUPPORT

Malvern's materials characterization technology and expertise enables scientists and engineers to understand and control properties of dispersed systems. Malvern's instruments are used to measure particle size, particle shape, zeta potential, molecular weight, size and conformation, rheology and for chemical identification. This information helps accelerate R&D, enhance product quality, optimize process efficiency.

Areas we work in:

- ACADEMIC BIOCHEMICAL RESEARCH
- BIOPHARMACEUTICALS
- FOOD AND DRINK
- ASPHALT
- PHARMACEUTICAL
- COSMETICS AND PERSONAL CARE
- CHEMICALS
- MINING AND MINERALS
- POWER GENERATION
- CEMENT
- METAL POWDERS
- PLASTICS AND POLYMERS
- SURFACE COATINGS
- ELECTRONICS
- CERAMICS
- ADHESIVES AND SEALANTS

Excellence through experience

Many Malvern systems are used in highly regulated environments and product validation and R&D traceability are priorities for our customers. Operating to ISO9001: 2000 with Tickit accreditation for software development, Malvern is a major supplier to the highly demanding pharmaceutical and chemical industries. Malvern's products play pivotal roles in high quality research and manufacturing throughout the world.

As a global supplier we believe we have responsibility to minimise the impact we have on the environment and operate to both ISO14001 and OHSAS18001.

Validation

To help our customers comply with the requirements of the Regulatory Authorities, such as the US Food and Drugs Administration (FDA) and the Medicines and Healthcare Products Regulatory Agency (MHRA), Malvern provides a comprehensive range of validation tools.

These aids follow a user's validation process through from Installation and Operational Qualification (IQ/OQ) to the maintenance phase with annual OQ renewals and the provision of standards for Performance Qualification (PQ). For products subject to FDA regulation, we have solutions to help with 21 CFR Part 11 compliance.

World-class service and support

Malvern offers professional support at all levels. Our intention is to increase your laboratory's productivity through the creation of a working relationship for the lifetime of your instrument providing service support, training and information.

- Global network of fully trained service personnel
- World-wide co-ordination for multi-national companies
- Technical support from the Malvern Helpdesk via telephone or email
- Range of maintenance contracts and service agreements to cover all requirements
- Validation support
- Consultancy-based on site training courses
- e-Learning training courses via the internet
- Classroom training courses
- Web Seminars
- Sample and application consultancy.
